

Cell interactions with protein micropatterns: a way to unravel cell adhesion dynamics and signaling

Marc R. Block

Laboratoire d'Etude de la Différenciation et de l'Adhérence Cellulaires
UMR CNRS/UJF 5538, Grenoble France

Mechanical constraint \Rightarrow Control of cell architecture

Mechanical constraint \Rightarrow Control of cell physiology

Stem cell fate
Cell death
Proliferation
Differentiation

Microstructuration of extracellular matrix

Adhesive square of $4 \times 4 \mu\text{m}$ (made of fibronectin, vitronectin...)

anti adhesive surfaces (Pluronic)

Micro fabrication based on "Lift off" technology
And non specific hydrophobic interactions

Characterization of the surfaces

Square Plots $4 \times 4 \mu\text{m}$ distance between patches: 4 to $18 \mu\text{m}$

Simplification of cell architecture on micro-patterned protein arrays

Quantitative cell shape analyses on structured surface

Cell compactness coefficient:

$$C = S/R$$

$$C = 0.78$$

$$C = 0.5$$

$$C = 1$$

Preferential cell distribution

Black squares: Diffusion Limited Agregation model

Preferential rectangular shapes do not depend on extracellular matrix protein

Video microscopy of cell spreading on structured matrix

Video microscopy of cell spreading on structured matrix

Classical Model

Observations on structured matrix

F-actin Localization

Rac-1 Localization

Filopodia transition depends on Rac1 signalling

Why spreading does not occurs at the angles?

Spreading on homogenous support

Swelling from filopodium basis

Hypothesis :

Integrins engagement is required for filopodia to lamellipodia transition

Spreading on patterned anti integrin antibodies

Patterned surfaces and cellular diagnosis

MEF *Icap* +/+

MEF *Icap* -/-

Patterned surfaces and cellular diagnosis

MEF *Icap* +/+

MEF *Icap* -/-

Adhesive microarrays with multiple proteins

What for?

Unidirectional movement

Polarization, differentiation

Cross talk between receptors
Integrins/syndecans
Integrins/cadherins
Integrins/growth factors

Making a microarray with two proteins

Preliminary results of micro-patterning

Alternative strategies (suitable for small areas)
Multiphoton excited polymerization

Suitable for 3D patterning
